## After getting a COVID-19 vaccine, will I test positive for COVID-19 on a viral test?

April 12, 2021 | [Health and safety](#), [Vaccine](#)

No. Neither the recently authorized and recommended vaccines nor the other COVID-19 vaccines currently in clinical trials in the United States can cause you to test positive on [viral tests](#), which are used to see if you have a current infection.

If your body develops an immune response—the goal of vaccination—there is a possibility you may test positive on some [antibody tests](#). Antibody tests indicate you had a previous infection and that you may have some level of protection against the virus. Experts are currently looking at how COVID-19 vaccination may affect antibody testing result.
